

INTELLIGENT - KEYLESS

GATE ACCESS MANAGEMENT SYSTEM

Eliminate Daisy Chain Locks...

A series of keyed and combination padlocks or "Daisy Chain of Locks" provides very little access control and management. Keys can be lost and combinations cannot be controlled. *"Terminated employees still have access to your facility when they know the combination."*

Using the GateCuff™ in conjunction with the FAMS™ Facility Access Management System provides Total Control...

- Elimination of manual padlock keys and combinations currently carried by personnel, by using programmable remote keyfob activation and deactivation
- Tracking of attempted use of deactivated keyfob
- Remote opening of gate from NOC
- Remotely control hours of access by individual personnel
- Controlled gate accessibility for facility personnel by using a RF key fob
- Gate activity is registered in the electronic control unit (ECU) so it can be accessed and audited for management evaluation and tracking

Audit Information Features Included in Gate Access (key fob) Audits:

- Who specifically opened the gate (by key fob code used)
- When gate was opened
- When gate was closed
- Which user group accessed the compound
- Whether an unauthorized entry was attempted
